

# Introduction to SQL for Data Engineers

**Giorgos Komninos** ([info@zendrom.com](mailto:info@zendrom.com))

**Senior Software Engineer** (<https://zendrom.com>)

# What are we going to learn?

- What is **Structured Query Language** ?
- Why you should learn **SQL** ?
- What is an **Relational Database Management System**?

# What are we going to learn (2)?

- Basic Concepts (Table, Field, Column, Row, Constraints)
- Querying in **SQL**
- Using **SQL** in Python

# What is SQL?

- Standardized language to for accessing databases
- Based on Relational Algebra
- We use **SQL** to select, insert, update data in relational databases

## SQL example

```
SELECT id, name from participants
```

# Why you should learn SQL?

- **SQL** is still the lingua franca of data
- 4th most popular language (stackoverflow 2018 survey)
- Skill needed for many jobs:

Data Scientist, Data Engineer, Backend Developer, Full Stack Developer

# What is an RDBMS

- Software
- Enables users to interact with a Relational Database
- Popular Open Source RDBMS: PostgreSQL, MySQL, SQLite, MariaDb ...

# Basic Concepts (1)

a relational database contains **tables**. The data are stored into these tables.

Tables have **names** and are composed of **columns** and **rows**

**name:** participants **columns:** id, name, city

#id	name	city
1	Argyris	Limassol
2	Ioannis	Limassol
3	Giorgos	Athens

Id is the **\*\*PRIMARY KEY\*\*** and it identifies uniquely each **\*\*row\*\***

```
CREATE TABLE participants
(id INTEGER PRIMARY KEY, name TEXT, city TEXT);
INSERT INTO participants(name, city) VALUES('Argyris', 'Limassol');
INSERT INTO participants(name, city) VALUES('Ioannis', 'Limassol');
insert into participants(name, city) values('Giorgos', 'Athens');
```

# Basic Concepts (2)

#id	pid	tech
1	1	python
2	1	sql
3	2	python
4	2	C

pid: **FOREIGN KEY**

```
CREATE TABLE part_techs
(pid INTEGER, tech TEXT,
CONSTRAINT fk_participants
FOREIGN KEY (pid) REFERENCES participants(id)
);
insert into part_techs(pid, tech) values
(1, 'python'), (1, 'sql'), (2, 'c');
```

# Querying in SQL

```
select * from participants;
```

```
1|Argyris|Limassol  
2|Ioannis|Limassol  
3|Giorgos|Athens
```

```
select * from part_techs;
```

```
1|python  
1|sql  
2|c
```

```
select * from participants where name like 'Argyris';
```

```
1|Argyris|Limassol
```

## Querying in SQL (2)

```
select A.name, T.tech from participants A
INNER join part_techs T on A.id = T.pid;
Argyris|python
Argyris|sql
Ioannis|c
```

```
select A.name, T.tech from participants A
LEFT join part_techs T on A.id = T.pid;
Argyris|python
Argyris|sql
Ioannis|c
Giorgos|
```

```
select A.name, T.tech from participants A
inner join part_techs T on A.id = T.pid
WHERE tech = 'sql';
Argyris|sql
```

## Querying in SQL (3)

```
select A.name, group_concat(T.tech) from participants A  
inner join part_techs T on A.id = T.pid group by T.pid;  
Argyris|python,sql  
Ioannis|c
```

```
select city, COUNT(Id) from participants group by city  
order by count(id) desc;  
Limassol|2  
Athens|1
```

# SQL and Python

- You need a RDBMS and a python driver
- Sqlite module is builtin in python  
(<https://docs.python.org/3/library/sqlite3.html>)
- Good for prototyping

# SQL and Python (2)

- [sqlite-demo.py](#) go through line by line
- [sqlite-demo.py](#) --num 1000000 # inserts 1.000.000 rows into table
- sample queries (city with most participants, participants knowing sql and python based in Limassol)
- Indexes (next talk 👍)

# Summary

- What is SQL
- Why you should learn
- Introduction to basic SQL
- SQLite and Python
